Ecology & Evolution

Outline

Introduction

- Antarctic Ecology 101
- Intro to computer vision
- Seal detection pipeline

Present work

- Training set
- Haul out detection CNNs
- Counting CNNs

Summary and next steps

Big Picture: How many pack-ice seals are in Antarctica?

Introduction

Antarctic Ecology 101

Antarctic Ecology 101

Antarctic Ecology 101

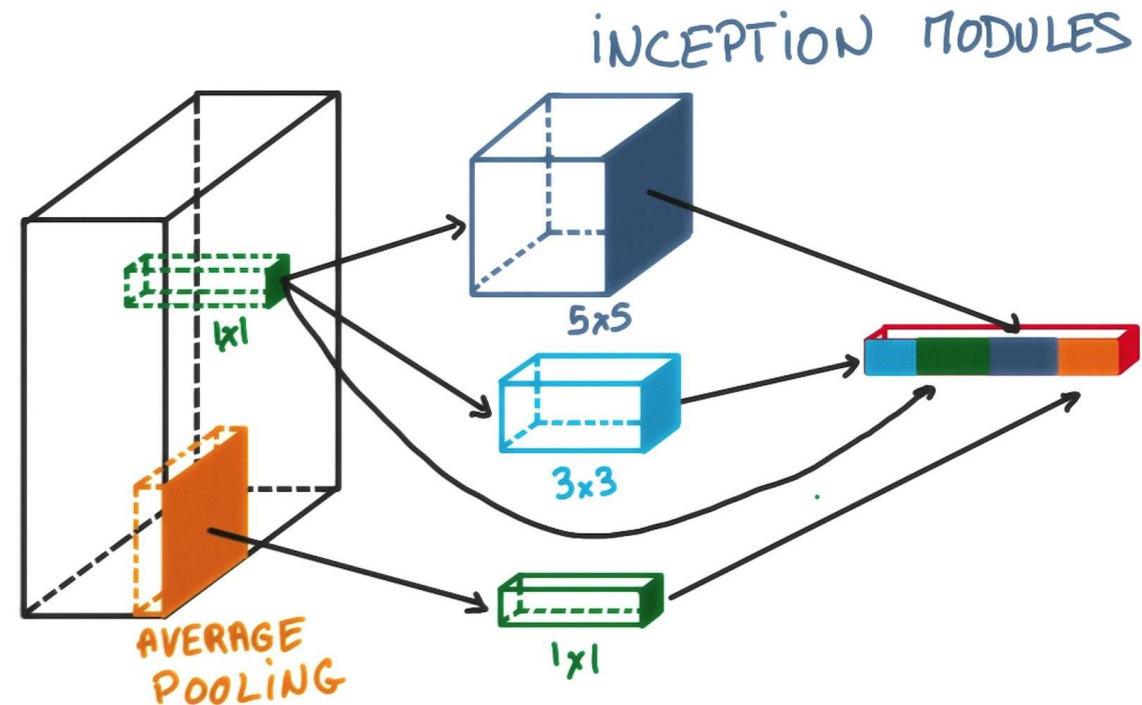

Intro to computer vision

- Artificial neural networks – Deep learning
- Convolutional neural networks (CNN)
 - Data hungry
 - Computationally expensive

Intro to computer vision

- Artificial neural networks – Deep learning
- Convolutional neural networks (CNN)
 - Data hungry
 - Computationally expensive
- CNN Architectures:
 - VGG16
 - Resnet
 - Inception

High-resolution satellite imagery

- WorldView-3
- 31cm resolution at nadir
- Coverage is not as good as low-res sensors (e.g. MODIS)
- Scene ($\sim 300 \text{ km}^2$) vs. Patch (1 ha)

Model framework – pipeline

STEP 1: Buffer out
scenes that are too far
from the coastline or
with too much cloud
cover, split remaining
scenes into patches

Model framework – pipeline

STEP 1: Buffer out scenes that are too far from the coastline or with too much cloud cover, split remaining scenes into patches

STEP 2: Extract environmental data at input locations

Model framework – pipeline

STEP 1: Buffer out scenes that are too far from the coastline or with too much cloud cover, split remaining scenes into patches

STEP 2: Extract environmental data at input locations

STEP 3: Sweep through patches with a classification CNN trained on groups of seals

Model framework – pipeline

STEP 1: Buffer out scenes that are too far from the coastline or with too much cloud cover, split remaining scenes into patches

STEP 2: Extract environmental data at input locations

STEP 3: Sweep through patches with a classification CNN trained on groups of seals

STEP 4: Locate and count individual seals inside flagged patches with a detection CNN

Groups of seals – crabeaters

Single seals

BONUS: emperor penguins

BONUS: emperor penguins

Present work

Training set creation

- Patch extraction
 - ~78000 labeled patches across >30 scenes
 - 11 training classes
- Context information:
 - Broad spatial context
 - Environmental covariates

Multiscale training set

- Spatial pyramid
- Provide broad spatial context
- Broad context bands down-sampled to patch size

Multiscale training set

- Spatial pyramid
- Provide broad spatial context
- Broad context bands down-sampled to patch size

Multiscale training set

- Spatial pyramid
- Provide broad spatial context
- Broad context bands down-sampled to patch size

Data augmentation scheme

- Random crops
- Random rotations
- Mirroring
- Contrast
- Brightness

Positive classes

Weddell seal – 981 patches

Crabeater seal – 4174 patches

Emperor penguin – 7105 patches

Marching-emperor – 1060 patches

Hard negatives

- 7 classes, including open water, pack ice (without seals), etc.

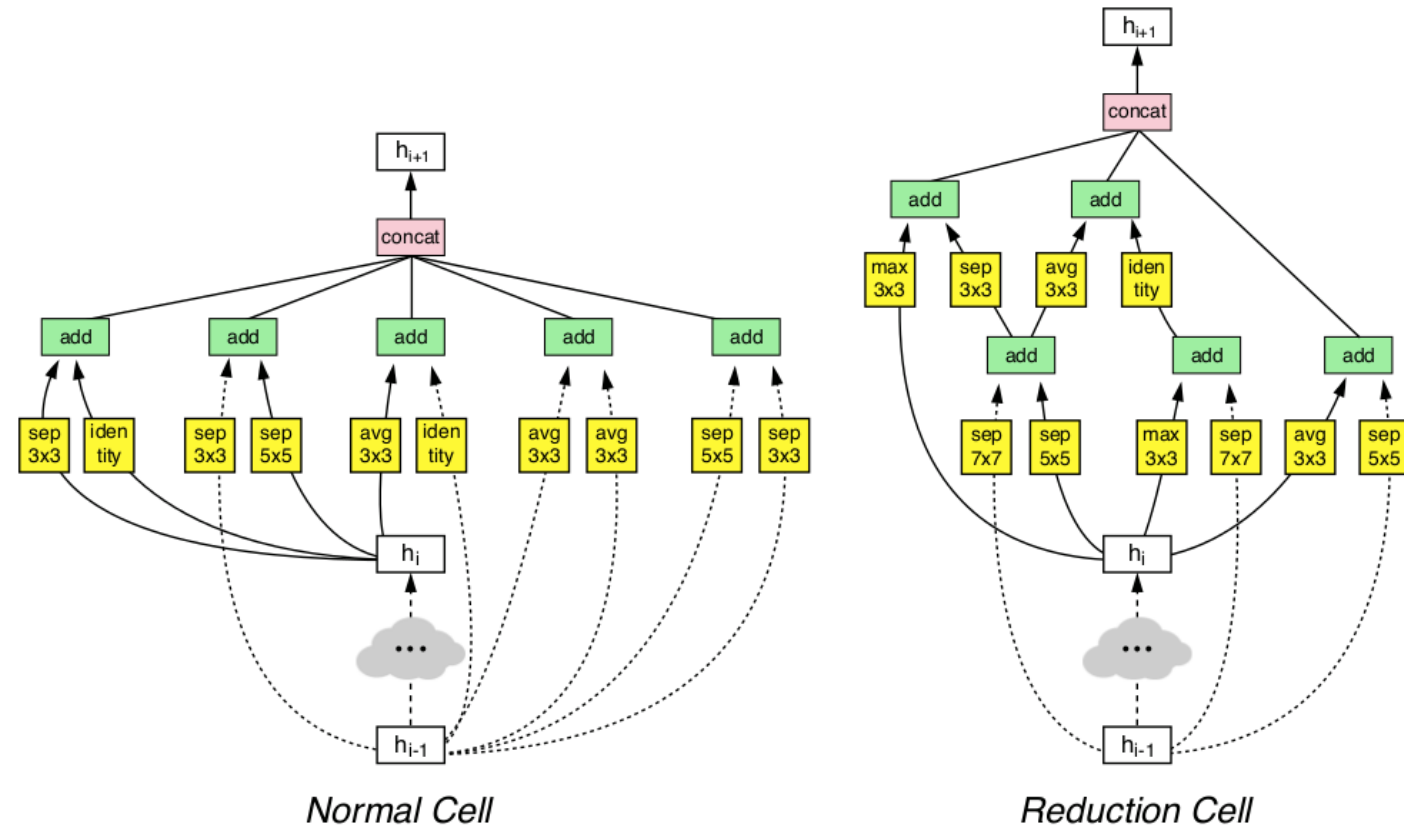

Haul out detection CNNs

Model architectures:

- Resnet18, Densenet169, etc.. (already implemented with PyTorch)
- NASNet (Zoph et al 2017)

Training setup

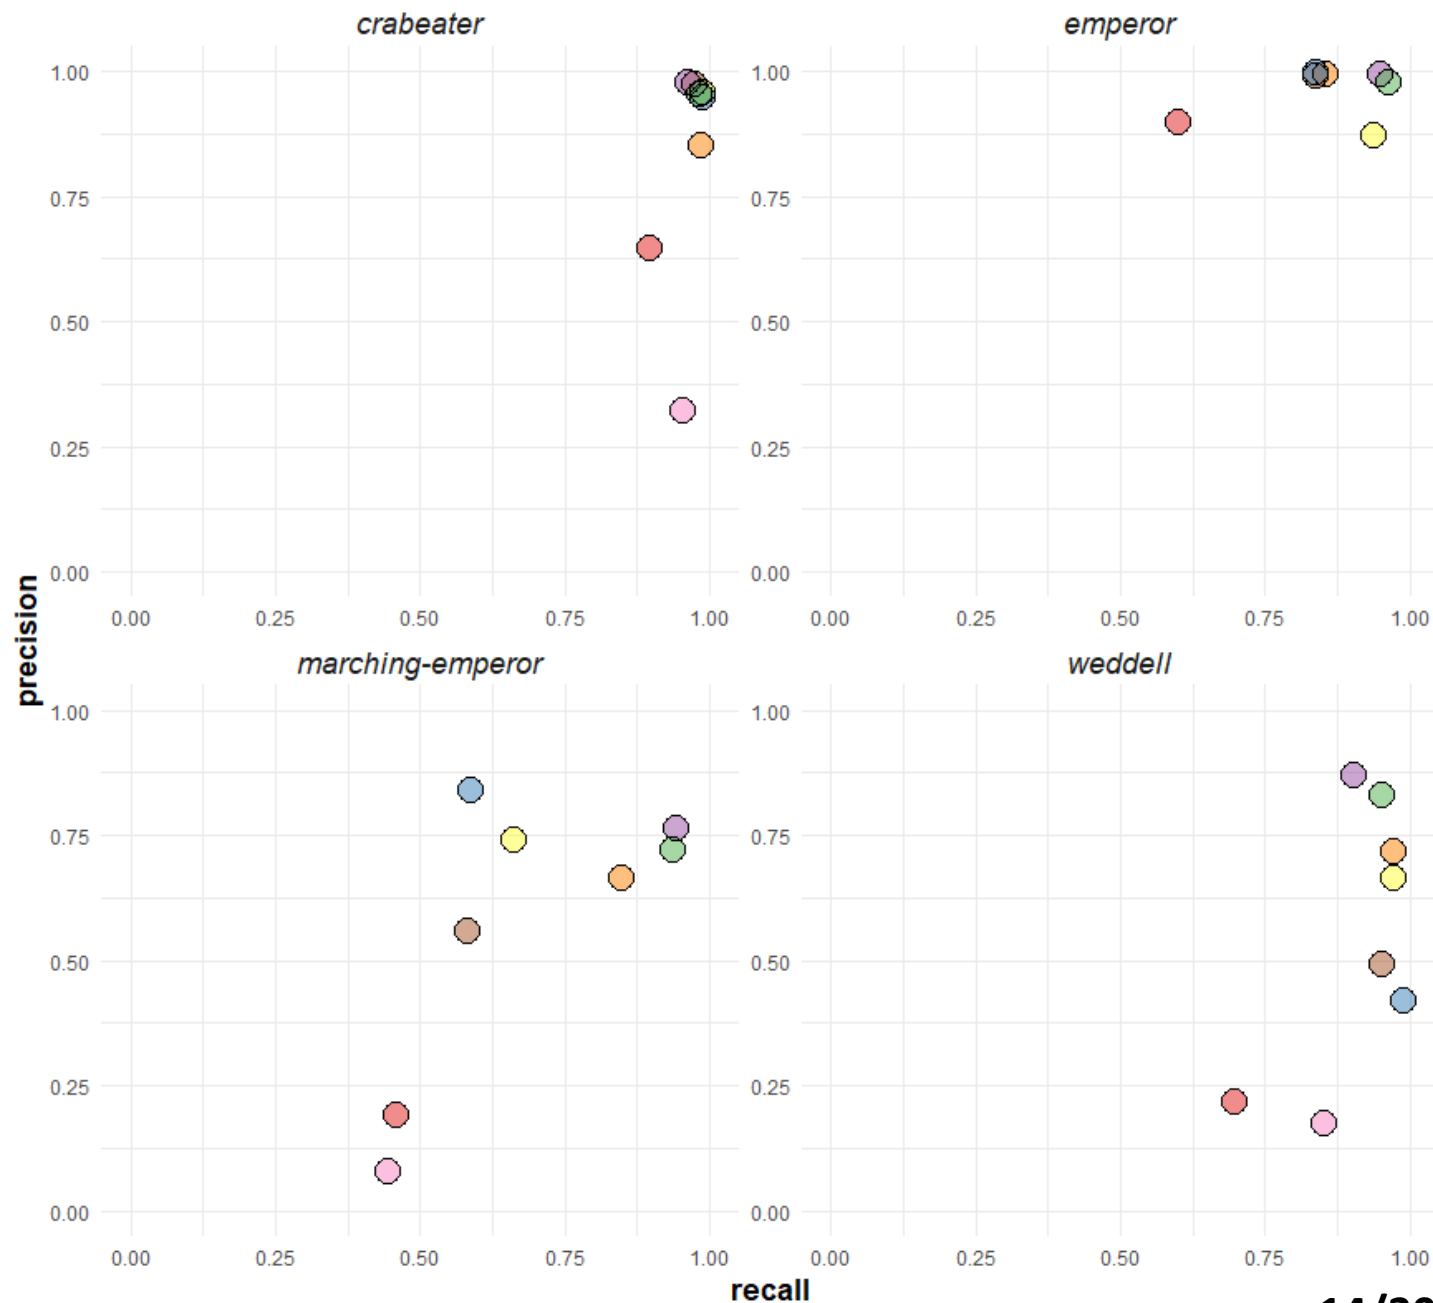

- Adam optimizer with learning rate 0.001 and 0.95 learning rate decay per epoch
- Trained from scratch with cross-entropy loss

Validation

- Best performing architecture is task dependent
- Precision:
$$\text{TP} / (\text{TP} + \text{FP})$$
- Recall:
$$\text{TP} / (\text{TP} + \text{FN})$$

model architecture

Solutions for counting small objects

Regression CNN

- Maps image to a real number
- Training objective: match ground-truth count (minimize mean-squared error)

Object detection CNN

- Detects individual seals in an image
- Training objective: match the position of predicted seals and ground-truth location (minimize Euclidean distance)

Regression CNNs

Model architectures

- CountCeption (Cohen et al 2017)
- WideResnet
- Modified classification CNNs

Subitizing

= 3

= 6

Validation results

model architecture

Pipeline output

Count

Class

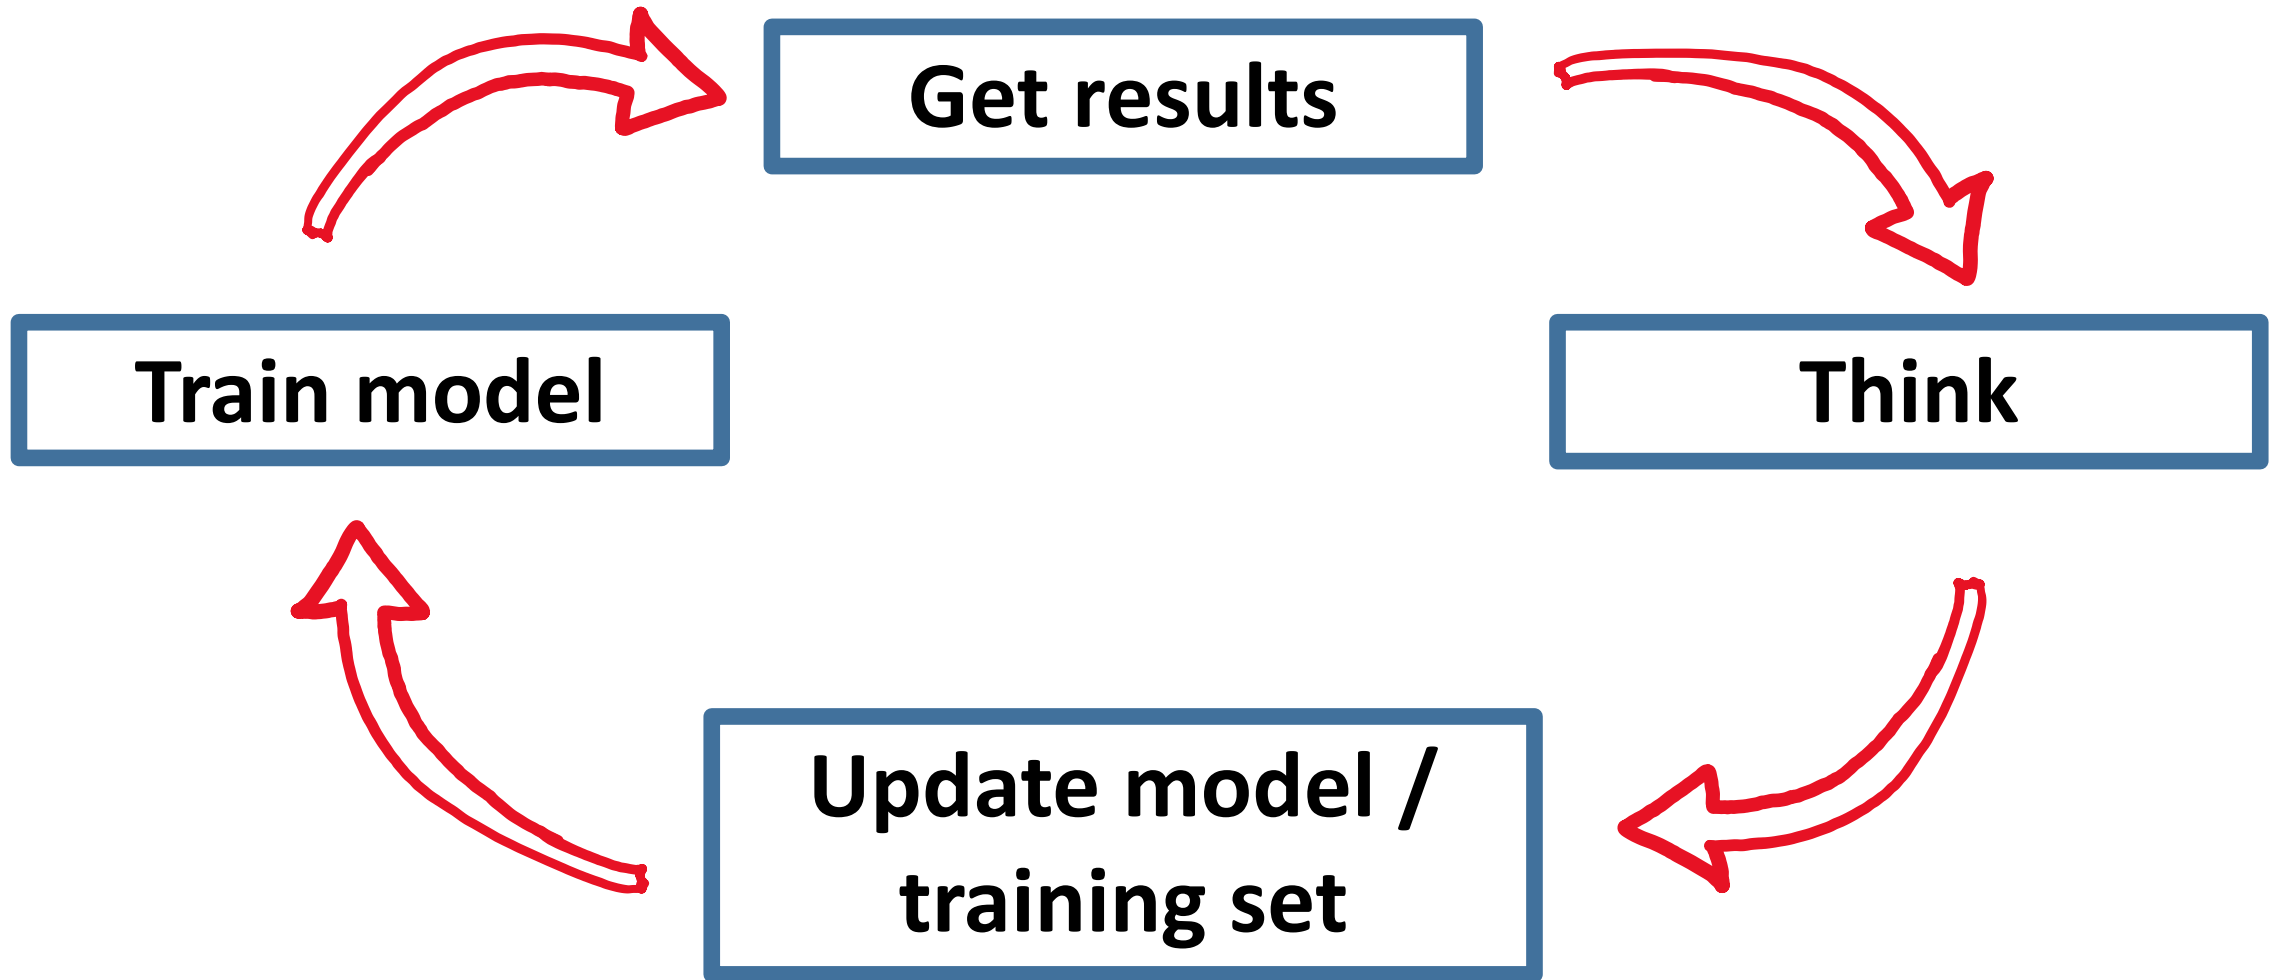

2018 onwards

Hyperparameter search

- The usual... (learning rate, decay, batch size, etc.)
- Input image size (training set and model)
- Augmentation scheme
- Number (and dimensions) of multi-scale bands (multiscale training set)
- Model architectures

Training a CNN: an iterative process

Summary

- Promising approach for pan-Antarctic pack-ice seal survey
- 2018 onwards:
 1. Larger training set (2017-18 imagery not yet incorporated)
 2. Apply pan-sharpening to panchromatic imagery training set
 3. Leverage environmental covariates and a priori knowledge about pack-ice seal biology
 4. Include broad spatial context for input patches
 5. Get better ground-truth for seal counts / locations

Summary

- Promising approach for pan-Antarctic pack-ice seal survey
- 2018 onwards:
 1. Larger training set (2017-18 imagery not yet incorporated)
 2. Apply pan-sharpening to panchromatic imagery training set
 3. Leverage environmental covariates and a priori knowledge about pack-ice seal biology
 4. Include broad spatial context for input patches
 5. Get better ground-truth for seal counts / locations

Computational resources significant – requires substantial investment in HPC cyberinfrastructure for imagery
